Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

Claim 1 (previously presented): An inner box for a cooker comprising:

a front plate having an opening portion; and

an inner main body bonded to a peripheral edge of the opening portion for cooking at inside of the inner main body;

wherein at least either one of bonding portions of the front plate and the inner main body includes a first fold-to-bend portion constituted by folding to bend an end portion thereof to invert to be brought into close contact therewith, and

a second fold-to-bend portion constituted by inverting a portion on a side of an end portion of the first fold-to-bend portion with a predetermined clearance therebetween, and

wherein other of the bonding portions of the front plate and the inner main body includes a flange portion inserted into the clearance between the first fold-to-bend portion and the second fold-to-bend portion, and calked to bond,

wherein the second fold-to-bend portion has a locking hole and the flange portion has a locking projection that extends through the locking hole.

Claim 2 (canceled)

Claim 3 (previously presented): The inner box for a cooker according to Claim 1, wherein the locking projection is a projection formed by punching machining.

Claim 4 (previously presented): The inner box for a cooker according to Claim 1, wherein insulating films are formed on a surface of the front plate on a side opposed to a side of being connected with the inner main body and an outer side surface of the inner main body.

Claim 5 (original): The inner box for a cooker according to Claim 3, wherein insulating films are formed on a surface of the front plate on a side opposed to a side of being connected with the inner main body and an outer side surface of the inner main body.

Claim 6 (withdrawn): A method of integrating the inner box for a cooker according to any one of Claim 1 through Claim 4, wherein end portions of face plates of the inner main body connected to the front plate are bonded to the front plate individually for the respective face plates.

Claim 7 (withdrawn): A method of integrating an inner box for a cooker, comprising the steps of:

bending and inverting an end portion of either one of a front plate and an inner main body to be brought into close contact therewith to form a first fold-to-bend portion

bending and inverting a portion of an end portion side of the first fold-to-bend

portion with a predetermined clearance therebetween to form a second fold-to-bend portion;

forming a flange portion to be inserted into the clearance between the first fold-to-bend portion and the second fold-to-bend portion; and

calking the first fold-to-bend portion and the second fold-to-bend portion and the flange portion.

Claim 8 (previously presented): The inner box for a cooker according to Claim 1, wherein the locking hole is in shape of long hole which act as a dowel hole.

Claim 9 (previously presented): The inner box for a cooker according to Claim 1, wherein the locking projection is spread in the locking hole by a pressure and inner peripheral face of the locking hole and the locking projection are brought into face contact with each other to prevent from being drawn out.

Claim 10 (currently amended): The inner box for a cooker according to Claim 4, wherein an inner peripheral portion of the locking hole is not formed with the insulating film and constitute a conducted face, and a ~~projecting~~ surface of the main body portion of the locking projection is a ~~matrix~~ metal face having conductivity, and therefore a front plate and a face plate of the inner box main body are electrically connected, and an excellent radio wave shielding effect is achieved.

Claim 11 (currently amended): The inner box for a cooker according to Claim 5, wherein

an inner peripheral portion of the locking hole is not formed with the insulating film and constitute a conducted face, and a ~~projecting~~ surface of the main body portion of the locking projection is a ~~matrix~~ metal face having conductivity, and therefore a front plate and a face plate of the inner box main body are electrically connected, and an excellent radio wave shielding effect is achieved.

Claim 12 (previously presented): The inner box for a cooker according to Claim 1, wherein the locking projection is formed to a drawn round hole projection.
